Open positions available!

The multinary material systems lab, at the Department of Chemistry in Bar-Ilan University, is searching for highly creative, motivated, and curious candidates, interested in materials science, machine learning techniques, and a sustainable future.

The lab combines different methods (combinatorial materials science, high-throughput investigation, and machine learning) to rationally design and synthesize multinary materials (many element materials) and investigate their process-structure-function properties for energy, catalysis, and sustainable fuels.

Multi- and interdisciplinary lab, young and dynamic environment.

M.Sc., Ph.D., and postdoc opportunities.
